Floating Ceiling Panel
Installation Instructions

Please note these Installation Instructions are the same for the Boyd Acoustic Round or Square Floating Ceiling Panels.

1. On the ceiling mark out where your Floating Ceiling Panel mounts need to go. Ensure your marks are in a square shape with the width of the square the same width as the bars installed on your Floating Ceiling Panel. This will ensure the wires hang straight once installed.

2. To install the Ceiling Fixings ① cut 4 equal lengths of wire based on the gap you need between the ceiling and the Floating Ceiling Panel. Insert the 4 wires into the Ceiling Fixings and tighten the supplied crimp around the wire to secure the end as shown ②.

3. Take the other end of the wire and feed it into the Panel Fixing ③ as shown. Secure the wire using an allen key (not provided). Screw the Panel Fixing back together and repeat for all 4 wires. You should now have 4 wires hanging with Panel Fixings connected.

4. Use 2 people to lift the Floating Ceiling Panel up to the ceiling and slide the Panel Fixings into the installed channel on the ceiling. Repeat for all 4 wires.

5. Check that the Floating Ceiling Panel is sitting flat and that all 4 wires hang straight. Adjust by sliding the Panel Fixing along the channel where necessary.

6. Screw the base of the Panel Fixing ④ down into the channel to lock it in place.

7. Once installed small adjustments can be made to the length of the wire by tightening or loosening the top of the Panel Fixing ⑤ .
